24-BIT QUADRATURE COUNTER

Feb 2018

FEATURES.

- Programmable count modes: non-quadrature, up/down, quadrature X1, X2 or X4, binary, BCD, 24-hour clock, mod-N and single cycle.
- Up to 40MHz count frequency in non-quadrature mode.
- 24-bit counter, 24-bit preset register and 24-bit comparator.
- 8-bit bi-directional data bus for uC interface.
- Readable status register.
- Carry, borrow, carry toggle and borrow toggle outputs.
- Compare and compare toggle outputs for counter to preset register equality.
- Programmable inputs for dynamic hardware control.
- TTL and CMOS compatible IOs.
- Operating voltage: 3V to 5.5V.
- Package types: DIP (LS7166A), SOIC (LS7166A-S), TSSOP (LS7166A-TS24).

GENERAL DESCRIPTION.

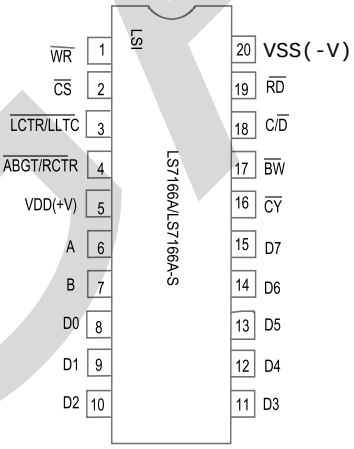
LS7166A is a CMOS, 24-bit counter which can be programmed to operate in several functional modes. The operating modes are set up by writing configuration data into control registers (see fig 8). There are three 6-bit and one 2-bit control registers for configuring the functional modes. In addition to the control registers there is a 5-bit status register which indicates the instantaneous device status. A 24-bit preset register is available for presetting the counter. It also serves as the division factor in the mod-N count mode. The device communicates with a host controller over an 8-bit 3-state bidirectional data bus through read/write operations. In addition, a number of discrete inputs and outputs facilitate instantaneous hardware control functions and instantaneous status indication.

REGISTER DESCRIPTION.

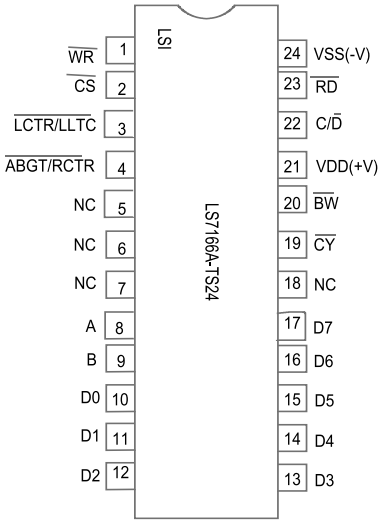
Hardware registers are accessible via the data bus (D7-D0) for read or write when CS = 0. The C/D input selects between a control register (C/D =1) and a data register (C/D = 0) during a read or write operation (see table 1).

PIN ASSIGNMENTS- Top View

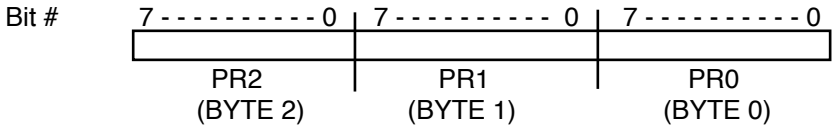
20-pin
DIP and SOIC



24-pin TSSOP



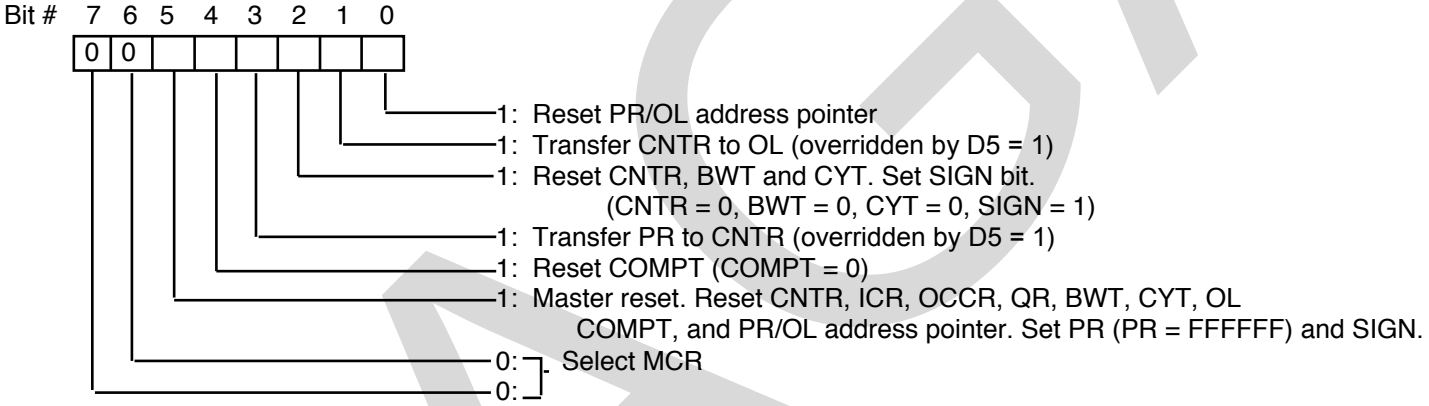
PR (Preset register). The PR is the input port for the CNTR. The CNTR is loaded with a 24 bit data via the PR. The data is first written into the PR in 3 WRITE cycle sequence of Byte 0 (PR0), Byte 1 (PR1) and Byte 2 (PR2).
The address pointer for PR0/PR1/PR2 is automatically incremented with each write cycle.
Accessed by: WRITE when C/$\overline{D}$ = 0, $\overline{CS}$ = 0.



Standard Sequence for Loading PR and Reading CNTR:

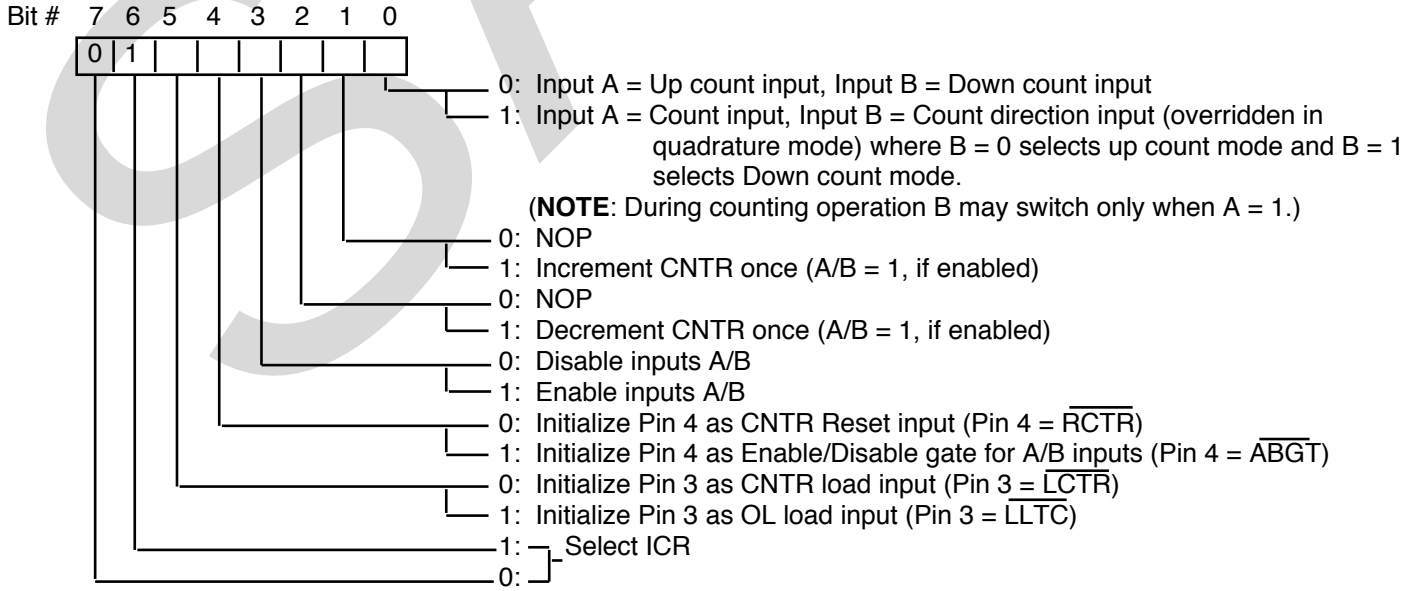
```
1 ⟶ MCR     ; Reset PR address pointer
WRITE PR    ; Load Byte 0 and into PR0 increment address
WRITE PR    ; Load Byte 1 and into PR1 increment address
WRITE PR    ; Load Byte 2 and into PR3 increment address
8 ⟶ MCR     ; Transfer PR to CNTR
```

MCR (Master Control Register). Performs register reset and load operations. Writing a "non-zero" word to MCR does not require a follow-up write of an "all-zero" word to terminate a designated operation.
Accessed by: WRITE when C/$\overline{D}$ = 1, $\overline{CS}$ = 0.



NOTE: Control functions may be combined.

ICR (Input Control Register). Initializes counter input operating modes.
Accessed by: WRITE when C/$\overline{D}$ = 1, $\overline{CS}$ = 0.



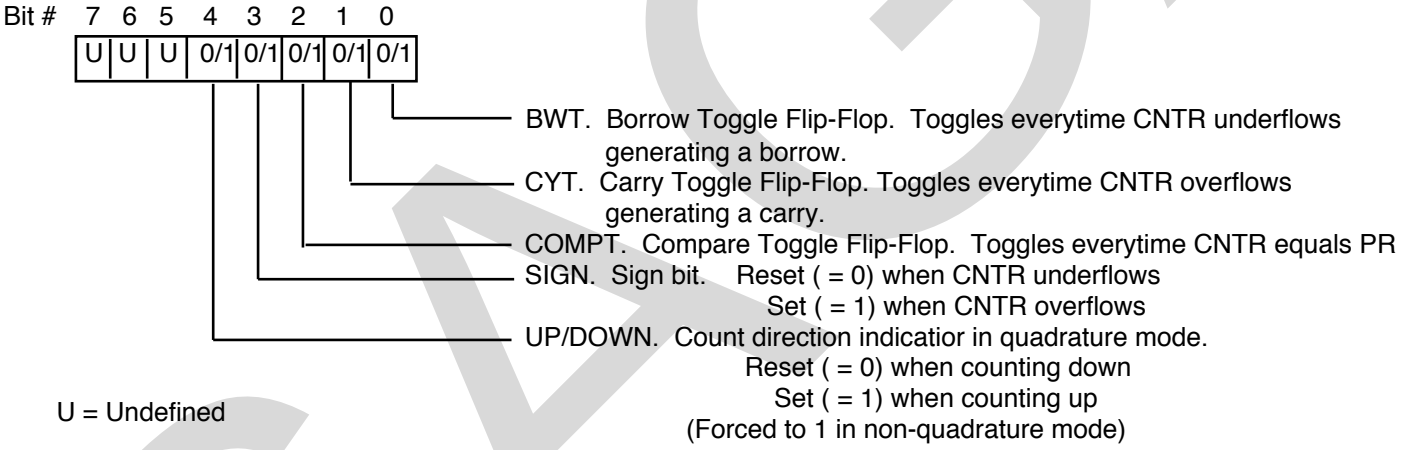
NOTE: Control functions may be combined.

TABLE 1 - Register Addressing Modes

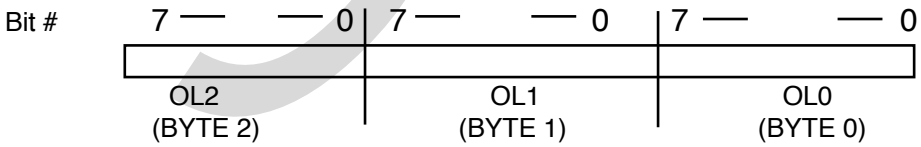
D7	D6	C/$\overline{D}$	$\overline{RD}$	$\overline{WR}$	$\overline{CS}$	COMMENT
X	X	X	X	X	1	Disable Chip for READ/WRITE
0	0	1	1	⌐⌊⌐	0	Write to Master Control Register (MCR)
0	1	1	1	⌐⌊⌐	0	Write to input control register (ICR)
1	0	1	1	⌐⌊⌐	0	Write to output/counter control register (OCCR)
1	1	1	1	⌐⌊⌐	0	Write to quadrature register (QR)
X	X	0	1	⌐⌊⌐	0	Write to preset register (PR) and increment register address counter.
X	X	0	⌐⌊⌐	1	0	Read output latch (OL) and increment register address counter
X	X	1	⌐⌊⌐	1	0	Read output status register (OSR).

X = Don't Care

OSR (Output Status Register). Indicates CNTR status: Accessed by**:** READ when C/$\overline{D}$ = 1, $\overline{CS}$ = 0.



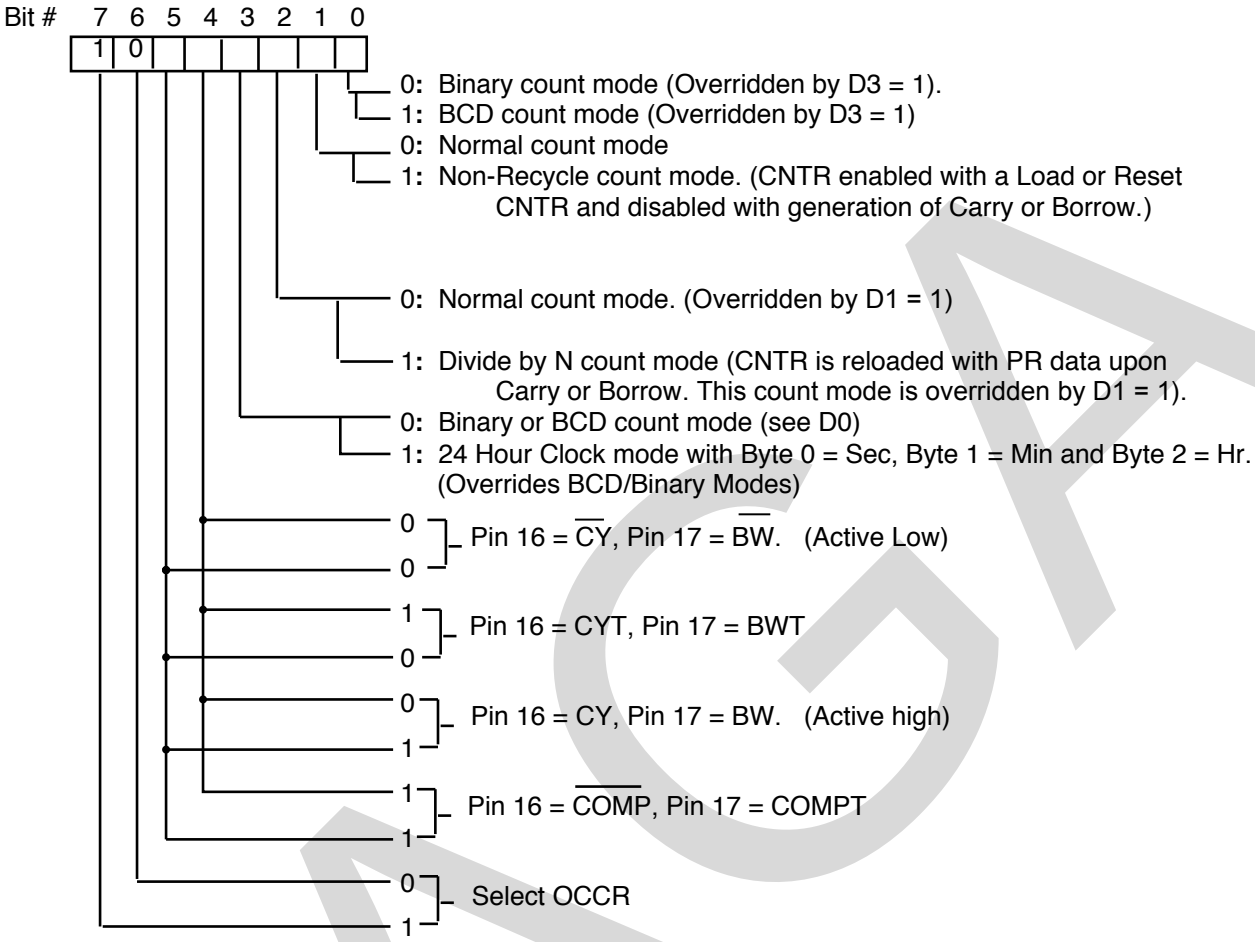
OL(Output latch). The OL is the output port for the CNTR. The 24 bit CNTR Value at any instant can be accessed by performing a CNTR to OL transfer and then reading the OL in 3 READ cycle sequence of Byte 0 (OL0), Byte 1 (OL1) and Byte 2 (OL2). The address pointer for OL0/OL1/OL2 is automatically incremented with each READ cycle. Accessed by**:** READ when C/$\overline{D}$ = 0, $\overline{CS}$ = 0.



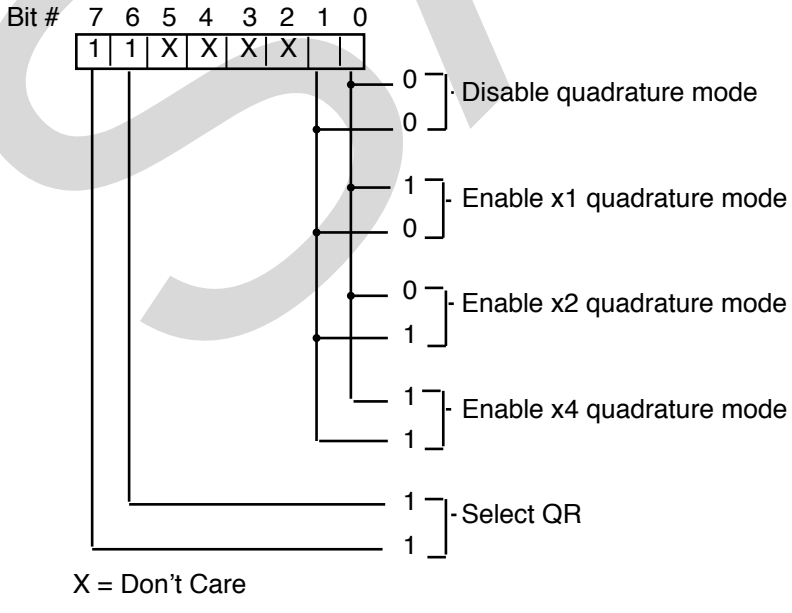
Standard Sequence for Loading and Reading OL**:**

```
3 ⟶ MCR     ;  Reset OL address pointer and Transfer CNTR to OL
READ OL     ;  Read Byte 0 and increment address
READ OL     ;  Read Byte 1 and increment address
READ OL     ;  Read Byte 2 and increment address
```

OCCR (Output Control Register) Initializes CNTR and output operating modes.
Accessed by **:** WRITE when C/$\overline{D}$ = 1, $\overline{CS}$ = 0.



QR (Quadrature Register). Selects quadrature count mode (See Fig. 7)
Accessed by**:** WRITE when C/$\overline{D}$ = 1, $\overline{CS}$ = 0.



I/O DESCRIPTION:
(See REGISTER DESCRIPTION for I/O Prgramming.)

Data-Bus (D0 - D7) (Pin 8 - Pin 15). The 8-line data bus is a three-state I/O bus for interfacing with the system bus.

$\overline{CS}$ (Chip Select Input) (Pin 2). A logical "0" at this input enables the chip for Read and Write.

$\overline{RD}$ (Read Input) (Pin 19). A logical "0" at this input enables the OSR and the OL to be read on the data bus.

$\overline{WR}$ (Write Input) (Pin 1). A logical "0" at this input enables the data bus to be written into the control and data registers.

C/$\overline{D}$ (Control/Data Input) (Pin 18). A logical "1" at this input enables a control word to be written into one of the four control registers or the OSR to be read on the I/O bus. A logical "0" enables a data word to be written into the PR, or the OL to be read on the I/O bus.

A (Pin 6). Input A is a programmable count input capable of functioning in three different modes, such as up count input, down count input and quadrature input. In non-quadrature mode, the counter advances on the rising edge of Input A

B (Pin 7). Input B is also a programmable count input that can be programmed to function either as down count input, or count direction control gate for input A, or quadrature input. In non- quadrature mode, and when programmed as the Down Count input, the counter advances on the rising edge of Input B. When B is programmed as the count direction control gate, B = 0 enables A as the Up Count input and B = 1 enables A as the Down Count input. When programmed as the direction input, B can switch state only when A is high.

$\overline{ABGT}$/$\overline{RCTR}$ (Pin 4). This input can be programmed to function as either inputs A and B enable gate or as external counter reset input. A logical "0" is the active level on this input. In non-quadrature mode, if Pin 4 is programmed as A and B enable gate input, it may switch state only when A is high (if A is clock and B is direction) or when both A and B are high (if A and B are clocks). In quadrature mode, if Pin 4 is programmed as A and B enable gate, it may switch state only when either A or B switches.

$\overline{LCTR}$/$\overline{LLTC}$ (Pin 3**)** This input can be programmed to function as the external load command input for either the CNTR or the OL. When programmed as counter load input, the counter is loaded with the data contained in the PR. When programmed as the OL load input, the OL is loaded with data contained in the CNTR. A logical "0" is the active level on this input.

$\overline{CY}$ (Pin 16) This output can be programmed to serve as one of the following:

A. $\overline{CY}$. Complemented Carry out (active "0").
B. CY. True Carry out (active "1").
C. CYT. Carry Toggle flip-flop out.
D. $\overline{COMP}$. Comparator out (active "0")

$\overline{BW}$ (Pin 17) This output can be programmed to serve as one of the following:

A. $\overline{BW}$. Complemented Borrow out (active "0").
B. BW. True Borrow out (active "1").
C. BWT. Borrow Toggle flip-flop out.
D. COMPT. Comparator Toggle output.

V_{DD} (Pin 5**)** Supply voltage positive terminal.

V_{SS} (Pin 20**)** Supply voltage negative terminal.

Absolute Maximum Ratings:

Parameter	Symbol	Values	Unit
Voltage at any input	V_{IN}	V_{SS} - 0.3 to V_{DD} + 0.3	V
Operating Temperature	T_A	-40 to +125	^oC
Storage Temperature	T_{STG}	-65 to +150	^oC
Supply Voltage	V_{DD} - V_{SS}	+7.0	V

DC Electrical Characteristics. (All voltages referenced to V_{SS}.
T_A = 0˚ to 85˚C, V_{DD} = 3V to 5.5V, fc = 0, unless otherwise specified)

Parameter	Symbol	Min. Value	Max.Value	Unit	Remarks
Supply Voltage	V_{DD}	3.0	5.5	V	-
Supply Current	I_{DD}	-	350	μA	Outputs open
Input Low Voltage	V_{IL}	0	0.8	V	-
Input High Voltage	V_{IH}	2.0	V_{DD}	V	-
Output Low Voltage	V_{OL}	-	0.5	V	4mA Sink, V_{DD} = 5V
Output High Voltage	V_{OH}	4.4	-	V	4mA Source, V_{DD} = 5V
Input Current	-	-	15	nA	Leakage current
Output Source Current	I_{SRC}	4	-	mA	V_{OH} = 4.4V, V_{DD} = 5V
Output Sink Current	I_{SINK}	4	-	mA	V_{OL} = 0.5V, V_{DD} = 5V
Data Bus Off-State Leakage Current	-	-	15	nA	-

TRANSIENT CHARACTERISTICS (See Timing Diagrams in Fig. 2 thru Fig. 7, V_{DD} = 3V to 5.5V, T_A = 0° to 85°C, unless otherwise specified)

Parameter	Symbol	Min.Value	Max.Value	Unit
Clock A/B "Low" (Note 1)	Tcl	15	No Limit	ns
Clock A/B "High" (Note 1)	Tch	10	No Limit	ns
Clock A/B Frequency (Note 1)	fc	0	40	MHz
UP/DN Reversal Delay (Note 1)	Tudd	30	-	ns
$\overline{LCTR}$ Positive edge to the next A/B positive or negative edge delay	T_{LC}	30	-	ns
Clock A/B to $\overline{CY}$/$\overline{BW}$/$\overline{COMP}$ "low" propagation delay	T_{CBL}	-	65	ns
Clock A/B to $\overline{CY}$/$\overline{BW}$/$\overline{COMP}$ "high" propagation delay	T_{CBH}	-	85	ns
$\overline{LCTR}$ and $\overline{LLTC}$ pulse width	T_{LCW}	60	-	ns
Clock A/B to CYT, BWT and COMPT "high" propagation delay	T_{TFH}	-	100	ns
Clock A/B to CYT, BWT and COMPT "low" progagation delay	T_{TFL}	-	100	ns
$\overline{WR}$ pulse width	T_{WR}	60	-	ns
$\overline{RD}$ to data out delay (C_L=20pF)	T_{RD}	-	11	ns
$\overline{CS}$, $\overline{RD}$ Terminate to Data-Bus Tri-State	T_{RT}	-	30	ns
Data-Bus set-up time for $\overline{WR}$	T_{DS}	30	-	ns
Data-Bus hold time for $\overline{WR}$	T_{DH}	15		ns
$\overline{CS}$ set-up time for $\overline{RD}$	T_{SRS}	0	-	ns
$\overline{CS}$ hold time for $\overline{RD}$	T_{SRH}	0	-	ns
Back to Back $\overline{RD}$ delay	T_{RR}	60	-	ns
$\overline{RD}$ to $\overline{WR}$ delay	-	60	-	ns
C/$\overline{D}$ set-up time for $\overline{RD}$	T_{CRS}	0		
C/$\overline{D}$ hold time for $\overline{RD}$	T_{CRH}	15		
C/$\overline{D}$ set-up time for $\overline{WR}$	T_{CWS}	30	-	ns
C/$\overline{D}$ hold time for $\overline{WR}$	T_{CWH}	15	-	ns
$\overline{CS}$ set-up time for $\overline{WR}$	T_{SWS}	60	-	ns
$\overline{CS}$ hold time for $\overline{WR}$	T_{SWH}	0	-	ns
Back to Back $\overline{WR}$ delay	Tww	60	-	ns
$\overline{WR}$ to $\overline{RD}$ delay	-	60	-	ns
Quadrature Mode:				
Clock A/B Validation delay	T_{CQV}	-	180	ns, V_{DD} = 5V
A and B phase delay	TPH	230	-	ns, V_{DD} = 5V
Clock A/B frequency	f_{CQ}	-	1.1	MHz, V_{DD} = 5V
$\overline{CY}$, $\overline{BW}$, $\overline{COMP}$ pulse width	T_{CBW}	120	170	ns, V_{DD} = 5V

NOTE 1: In non-quadrature mode only.

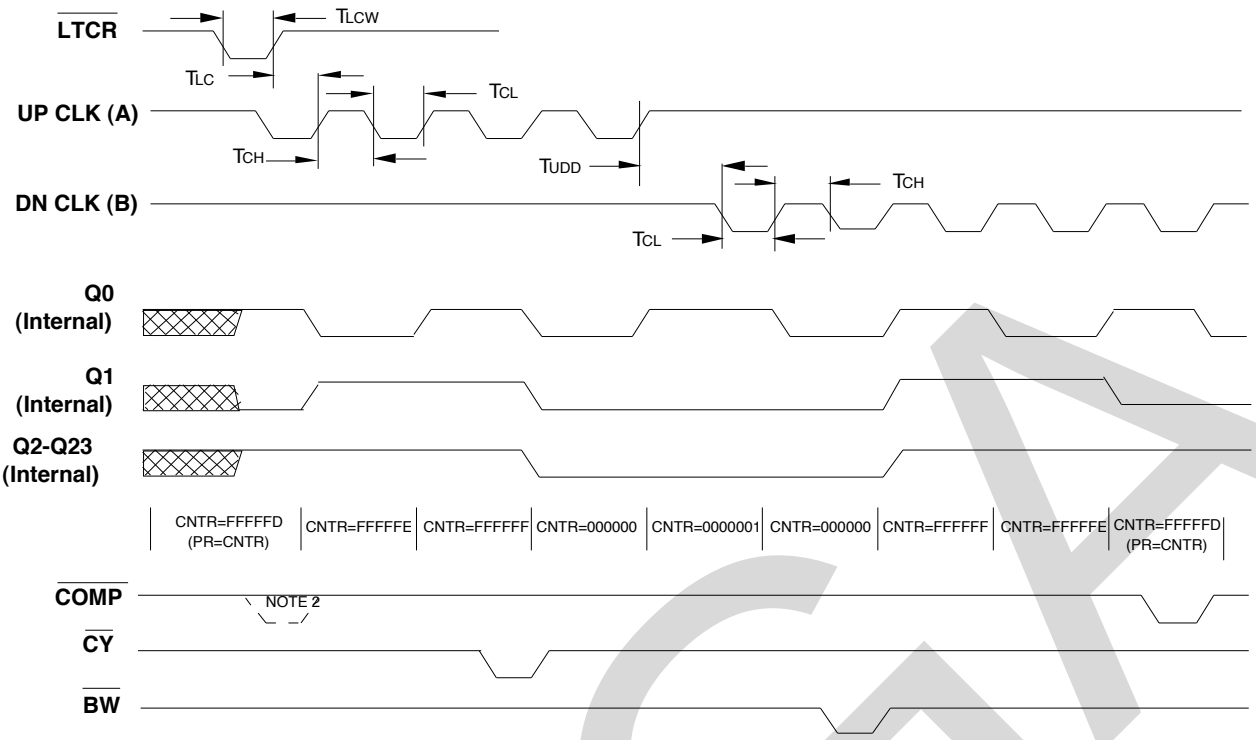


FIGURE 2 . LOAD COUNTER, UP CLOCK, DOWN CLOCK, COMPARE OUT, CARRY, BORROW

NOTE 1: The counter in this example is assumed to be operating in the binary mode.
NOTE 2: No COMP output is generated here, although PR = CNTR. COMP output is disabled with a counter load command and enabled with the rising edge of the next clock, thus eliminating invalid COMP outputs whenever the CNTR is loaded from the PR.
NOTE 3: When UP Clock is active, the DN Clock should be held "HIGH" and vice versa.
